

---+ Package TWiki::UI::Oops

UI delegate for oops function

StaticMethod oops_cgi (\$session)

oops command handler. This method is designed to be invoked via the `UI::run` method. CGI parameters:

template	name of template to use
paramN	Parameter for expansion of template

`%PARAMn%` tags will be expanded in the template using the 'paramN' values in the query.

StaticMethod oops (\$session, \$web, \$topic, \$query, \$keep)

The body of an oops script call, abstracted out so it can be called for the case where an oops is required, but all the parameters in the query must be saved for passing on to another URL invoked from a form in the template. If `$keep` is defined, it must be a reference to a hash (usually an `oopsexception`) that defines the parameters to the script (template, def etc). In this case, all the parameters in the `$query` are added as `hiddens` into the expanded template.
