

---+ Package TWiki::Users::HtPasswdUser

Support for httpasswd and htdigest format password files.

Subclass of TWiki::Users::Password. See documentation of that class for descriptions of the methods of this class.

ObjectMethod finish ()

Break circular references.

ObjectMethod readOnly () -> boolean

returns true if the password file is not currently modifyable

ObjectMethod getMustChangePassword (\$cUID) -> \$flag

Returns 1 if the \$cUID must change the password, else 0. Returns undef if \$cUID not found.

ObjectMethod getUserData (\$cUID) -> \$dataRef

Return a reference to an array of hashes with user data, used to manage users. Each item is a hash with:

- {name} - name of field, such as "email"
- {title} - title of field, such as "E-mail"
- {value} - value of field, such as "jimmy@example.com"
- {type} - type of field: text, password, checkbox, label
- {size} - size of field, such as 40
- {note} - comment note, if any

User management forms can be build dynamically from this data structure. Each password manager may return a different set of fields.

ObjectMethod setUserData (\$cUID, \$dataRef)

Set the user data of a user. Same array of hashes as getUserData is assumed, although only {name} and {value} are used.

Returns an empty string if save action is OK, or an error string starting with 'Error: ' if there is an error.
