---+ Package `TWiki::Users::HtPasswdUser`

Support for htpasswd and htdigest format password files.

Subclass of `TWiki::Users::Password`. See documentation of that class for descriptions of the methods of this class.

ObjectMethod finish `()`

Break circular references.

ObjectMethod readOnly `() -> boolean`

returns true if the password file is not currently modifyable

ObjectMethod getMustChangePassword `($cUID) -> $flag`

Returns 1 if the $cUID must change the password, else 0. Returns undef if $cUID not found.

ObjectMethod getUserData `($cUID) -> $dataRef`

Return a reference to an array of hashes with user data, used to manage users. Each item is a hash with:

- `{name}` - name of field, such as "email"
- `{title}` - title of field, such as "E-mail"
- `{value}` - value of field, such as "jimmy@example.com"
- `{type}` - type of field: `text`, `password`, `checkbox`, `label`
- `{size}` - size of field, such as `40`
- `{note}` - comment note, if any

User management forms can be build dynamically from this data structure. Each password manager may return a different set of fields.

ObjectMethod setUserData `($cUID,$dataRef)`

Set the user data of a user. Same array of hashes as getUserData is assumed, although only `{name}` and `{value}` are used.

Returns an empty string if save action is OK, or an error string starting with 'Error: ' if there is an error.
